TASK 1 | WEB APP QA & DEBUG REPORT

Conduit - RealWorld demo application

Prepared by	Rohan Salunkhe	Test date	10 November 2026
Application	Conduit (RealWorld demo)	Test URL	https://demo.realworld.show/
Test approach	Manual black-box testing	Environment	Desktop web browser

1. Objective and Scope

The objective was to exercise the main user flows of the Conduit web application, identify issues that could affect production usability, and document observable behaviour. Testing covered account registration and sign-in, article creation/editing/deletion, comments, favourites, profile settings, validation messages, logout, and access to an editor route while logged out.

2. Test Execution Summary

Area	Tests performed	Observed result	Status
Registration and sign-in	Valid registration; malformed email; correct credentials; wrong password.	Valid registration and sign-in succeeded. Invalid email was rejected; wrong password returned credentials invalid.	**Passed**
Article lifecycle	Required-field validation; create; edit; refresh; delete; special characters; short article body.	Required fields were enforced. Article creation, editing, persistence after refresh, and deletion worked. Special characters were accepted.	**Passed**
Comments	Valid comment; blank comment; refresh; delete comment.	Valid comment posted and remained after refresh. Blank comment was rejected with body can't be blank. Comment deletion succeeded.	**Passed**
Favourites	Add favourite; refresh; remove favourite.	Favourite count changed, persisted after refresh, and could be removed.	**Passed**
Profile settings	Update bio; invalid image URL; invalid email; bio over 400 characters; blank username.	Bio update worked. Invalid email, over-limit bio and blank username were rejected. Invalid image URL rendered a broken image after refresh.	**Mixed**
Session/access	Logout; back navigation; direct editor URL after logout.	Logout returned to public navigation. Editor access was not available while logged out.	**Passed**

3. Bug Report / UX Observations

Each item below was observed during the test session. The expected behaviour is framed as a usability recommendation where the application did not publish an explicit requirement.

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	**Missing delete confirmation**	Open an article owned by the test account, then click Delete Article.	Expected (UX recommendation): Ask for confirmation before a destructive action. Actual: The article was deleted immediately; no confirmation popup appeared.	**Low**	The delete action may execute immediately without a confirmation-dialog step. This is a usability recommendation, not a stated functional requirement.
2	**Broken profile image for an invalid URL**	Open Settings; enter a non-existent profile image URL; update settings; refresh the profile page.	Expected (UX recommendation): Show a fallback avatar or a clear validation warning. Actual: A broken image icon remained visible after refresh.	**Low**	The profile image component may not provide an image-load error fallback or validate the URL before saving.
3	**Duplicate Edit and Delete controls**	Sign in and open an article owned by the test account.	Expected: One clear set of article actions. Actual: Two sets of Edit Article and Delete Article controls were visible on the article detail page.	**Low**	The article action controls may be rendered in two separate page sections when only one set is needed.
4	**Unclear bio validation message**	Open profile settings; enter a bio longer than 400 characters; click Update Settings.	Expected: A user-facing message such as Bio must be under 400 characters. Actual: The message shown was body bio is a string of less than 400 char.	**Low**	A backend-style validation string may be shown directly instead of being mapped to a clear field-level message.
5	**Unclear username validation message**	Open profile settings; clear the username field; click Update Settings.	Expected: A clear message such as Username is required. Actual: The message shown was body username is a string of less than 60 chars.	**Low**	The application may display a generic/backend validation message without translating it into user-focused guidance.

Conclusion

The main tested flows for registration, sign-in, article creation/editing/deletion, comments, favourites, profile updates, and logout generally behaved as expected. Five low-severity UX/UI observations have been documented with reproduction steps, expected-versus-actual behaviour, and suspected causes. The report is based on the visible behaviour of the demo application on 10 November 2026; further verification with application requirements and implementation details is recommended before treating these observations as confirmed product defects.

4. Root Cause Analysis

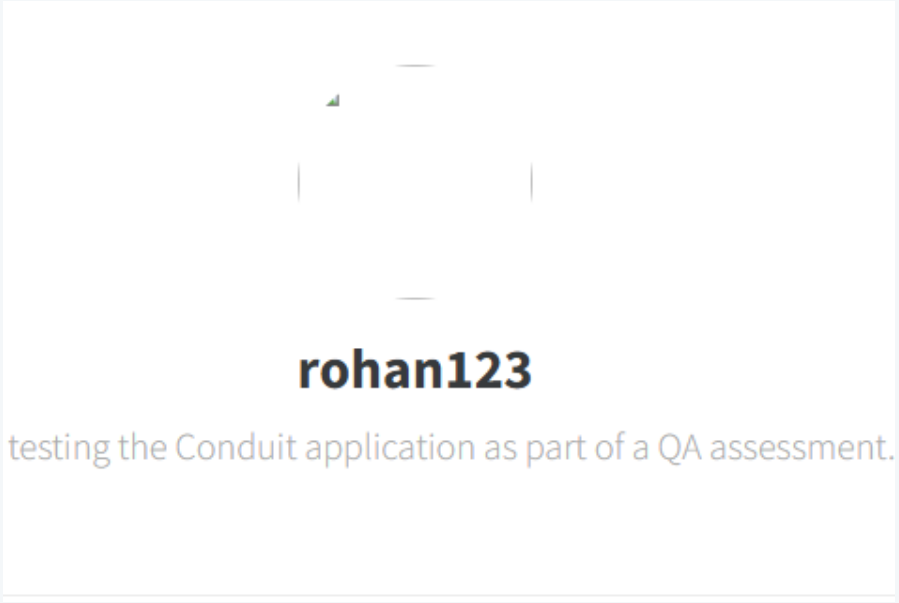

Selected issue: unclear profile validation messages

The application rejected invalid profile values, so the underlying validation checks appeared to be active during testing. However, the interface displayed technical messages such as body bio is a string of less than 400 char and body username is a string of less than 60 chars. These messages do not clearly tell users which correction is needed. A possible cause is that backend validation text is being displayed directly without a user-facing message-mapping layer. I would map each validation response to a concise field-specific message, such as Bio must be under 400 characters or Username is required. I would keep server-side validation in place and make sure the UI presents the related field error clearly. After the change, I would retest blank, over-limit, and valid values and verify that valid profile updates still save. Because this was black-box testing, the proposed cause is a hypothesis and should be checked against the implementation or logs.

5. Screenshot Evidence

Evidence 1 - Article detail page shows duplicate Edit Article and Delete Article controls in two locations.

Evidence 2 - Invalid profile image URL results in a broken image icon on the profile page after refresh.
